

Q. No. 2 (i) Electrical conductivity is the property of an element or compound to conduct electricity by free electrons and ions. In case of molten NaCl, free ions are available as:

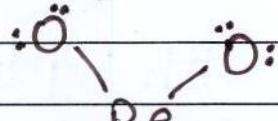

These ions conduct electricity while in case of AlCl<sub>3</sub> in solid state ions are not free to move while in molten state at high pressure there are no ions. So it does not conduct electricity in either state.

Q. No. 2 (ii) a) BeO is amphoteric in nature. It can react with both acids and bases.

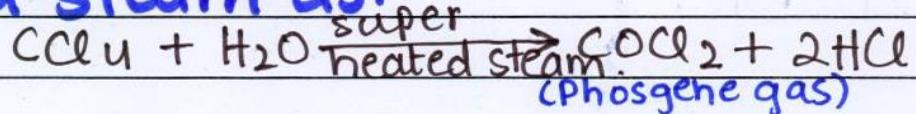

b) BeO is covalent in nature but has high melting point because it is linked tetrahedrally with 4 oxygen atoms thus higher temperature is required to break the bonds.

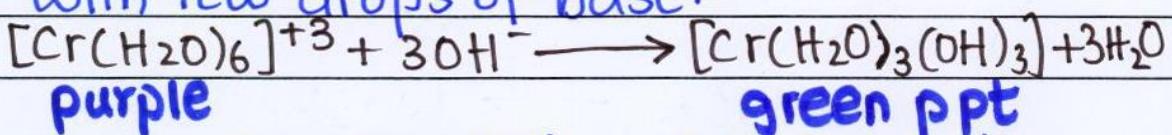

**Q. No. 2 (iii) a-** Group VI A elements show two oxidation states +4 and +2. Down the group stability of +2 oxidation state increases i.e.  $\text{Pb}^{+2} > \text{Pb}^{+4}$ . That is why  $\text{PbCl}_4$  in which  $\text{Pb}^{+4}$  ion is present is unstable while  $\text{PbCl}_2$  is stable.

b. tetrahalides of carbon do not undergo hydrolysis because they belong to 2nd period and do not have vacant d orbitals which can accept lone pair of oxygen atom of water to form intermediate complex. However they can be hydrolysed by super heated steam as:

Q. No. 2 (iv)  $[\text{Cr}(\text{H}_2\text{O})_6]^{+3}$  can be oxidized to  $\text{CrO}_4^{2-}$  by following three reactions:-

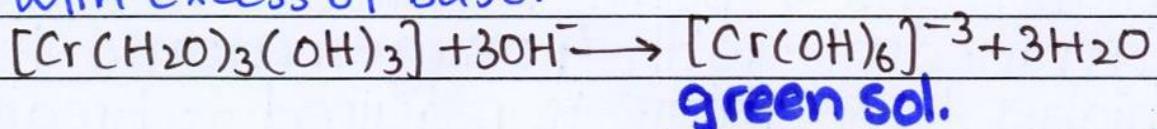

- with few drops of base:-

## hexaaqua chromium (III)

triaqua trihydroxo  
chromium (III)

- With excess of base:

hexahydroxo chromate  
(III)

- reaction with hydrogen peroxide:

Q. No. 2 (v) Iron exists in two oxidation states  $\text{Fe}^{+2}$  and  $\text{Fe}^{+3}$ . It acts as a catalyst in the following reaction:-

The reaction proceeds as:-

- $\text{S}_2\text{O}_8^{-2} + 2\text{Fe}^{+2} \longrightarrow 2\text{SO}_4^{-2} + 2\text{Fe}^{+3}$
- $2\text{Fe}^{+3} + 2\text{I}^- \longrightarrow \text{I}_2 + 2\text{Fe}^{+2}$

As  $\text{Fe}^{+2}$  is regenerated it acts as catalyst.

If  $\text{Fe}^{+3}$  ion is present, 2nd reaction will proceed first.

Q. No. 2 (vi) "Functional group refers to atoms or group of atoms which give a compound its characteristic properties." e.g.  $-\text{OH}$ ,  $-\text{NH}_2$ , etc. The concept of functional group is important because:-

- It serves as a basis for nomenclature (naming of organic compounds).
- It serves as a basis for classification of organic compounds. Compounds belonging to same class have same functional groups.
- Functional group is the site of chemical

Q. No. 2 (vii)

## STRUCTURAL ISOMERISM

- Compounds having same molecular formula but **different arrangement of atoms within molecule.**
- Same molecular formula and **different structural formula.**
- Types include, Chain isomerism, Position, Functional group, metamerism, tautomerism.

## STEREO ISOMERISM

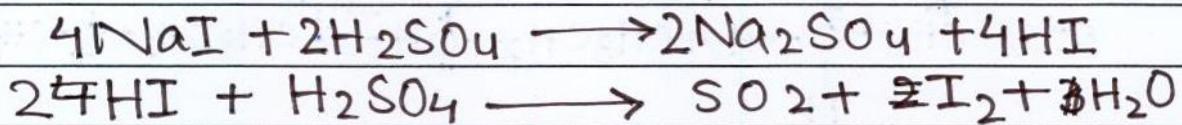

- Compounds having same molecular formula but **differ in orientation of atoms in space.**
- Same molecular and structural formula but **different configuration.**
- Types include
  - 1 - optical isomerism
  - 2 - geometrical

Q. No. 2 (viii)

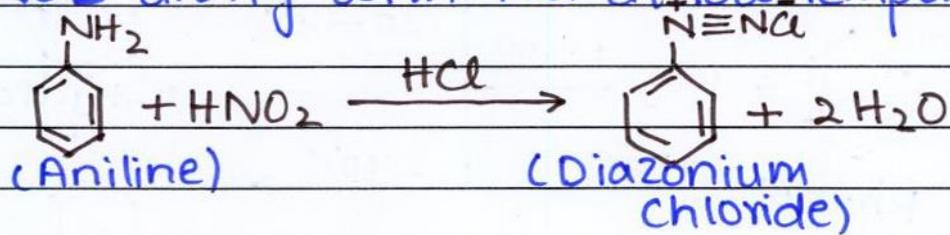

**Q. No. 2 (ix)** The trend of halide ions as reducing agent is  $I^- > Br^- > Cl^- > F^-$ . As we move down the group, **atomic size increases** thus hold of nucleus on outer electrons becomes weak. Thus, electrons can be easily lost. That is why  $I^-$  ion is most powerful reducing agent.

It reacts with  $H_2SO_4$  as follows:-

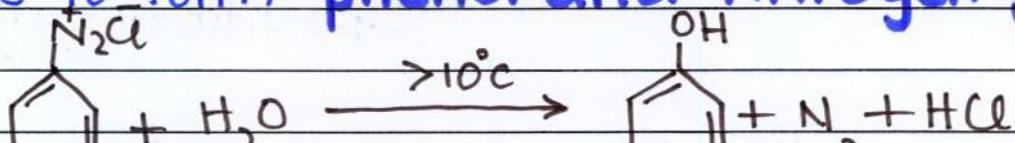

In this reaction  $\text{I}^-$  ion is reducing sulphur in  $\text{H}_2\text{SO}_4(+6)$  to +4 in  $\text{SO}_2$  while is being oxidized itself.

Q. No. 2 (x) Diazonium salts are compounds having nitrogen atoms joined by triple bond (-N≡N-).  
It can be prepared by reacting aniline with  $\text{HNO}_2$  along with  $\text{HCl}$  at low temperature:-

At higher temperature (above 10°C) it hydrolysis to form phenol and nitrogen gas:

Q. No. 2 (xviii) "The separation of different miscible liquids on the basis of **difference in boiling points** by **evaporation and condensation** is refining of petroleum." (Fractional Distillation.)

→ PRINCIPLE :

It is done in a large **fractionating tower**. The petroleum is heated under high pressure and high temperature ( $\approx 400^{\circ}\text{C}$ ). The components with **low boiling point** and more volatile **boil out first** while the components with high boiling point and more "val" volatile boil out next. These components then **condense** according to their boiling points and are separately collected.

## GEOMETRICAL ISOMERISM

Geometrical isomerism or **cis-trans isomerism** results from **restriction in rotation** about double bond or about single bond in cyclic compounds.

→ CIS ISOMER:

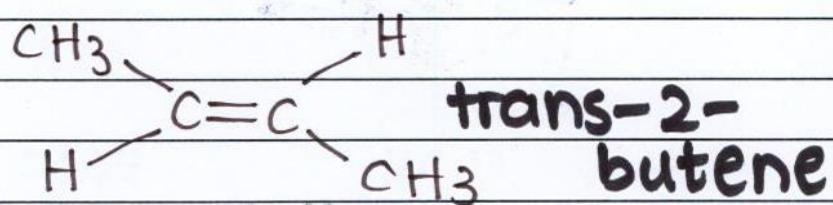

which contains  
**bulky groups on same side** of double  
bond e.g.

These are **less stable** due to steric effect.

→ TRANS ISOMER:

which contains  
**bulky groups on opposite sides** of double  
bond e.g.

These are more stable.

22

The relevant question should be answered only in the allotted space and inside the outer mark

23052831

Q. No. 4 (Page 2/6)

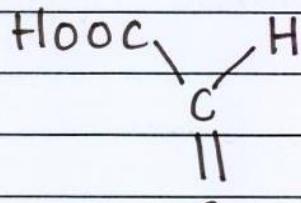

## CONDITIONS :-

Not all alkenes show geometrical isomerism :-

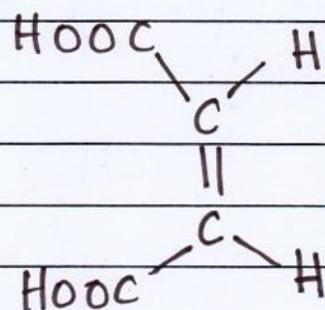

- atleast one double bond must be present in alkenes and in case of single bond compound should be cyclic.
- Both double bonded carbons must be attached to **two different atoms or groups**.
- In cycloalkanes, two groups other than H must be present on **two carbon atoms**.

## EXAMPLE FROM ALKENES

In alkenes, **Butenedioic acid** shows geometrical isomerism:-

trans-butenedioic  
acid  
→ Fumaric acid

cis-butenedioic  
acid  
→ Maleic acid

## EXAMPLE FROM CYCLOALKANES:-

In cycloalkanes, **1,2-dimethyl cyclopropane** shows geometrical isomerism:

**cis-1,2-dimethyl cyclopropane**

**trans-1,2-dimethyl cyclopropane.**

Geometrical isomers have **different physical and chemical properties** and are a type of **stereoisomers**.

## b) ENZYME INHIBITION

"When a compound attaches with enzyme and **decreases its activity** it is known as **enzyme inhibition**."

Enzyme Inhibition is of the following two types on the basis of type of bond formed between enzyme and inhibitor.

### I-IRREVERSIBLE:

The relevant question should be answered only in the allotted space and inside the outer mark

24

23052831

Q. No. 4 (Page 4/6)

bonds are formed between the enzyme and inhibitor and enzyme activity cannot be restored.

## 2. REVERSIBLE:

The type of inhibition in which enzyme activity can be restored is known as reversible inhibition. It is further of two types:-

### a) COMPETITIVE:

In competitive inhibition, the inhibitor is structurally similar to substrate and thus can bind to active site. When competitive inhibitor is present, the substrate can not bind to the active site and reaction will not be catalyzed. Competitive inhibition can be overcome by increasing the concentration of normal substrate.

### b) NON-COMPETITIVE:

The inhibitor attaches to enzyme other than the active. It binds to the non-active site (allosteric site) thus, changing

## IODOFORM TEST

" carbonyl compounds containing  $\text{CH}_3\text{CO}-$  group react with  $\text{I}_2$  in presence of an alkali to form yellow crystals of iodoform."

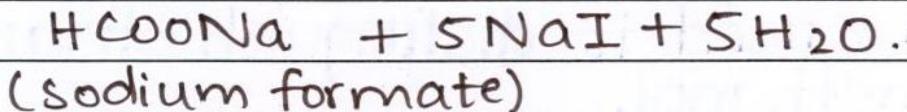

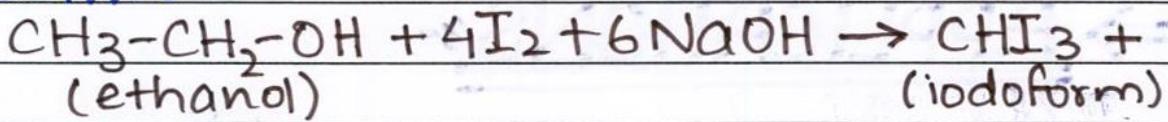

### GENERAL EQUATION:-

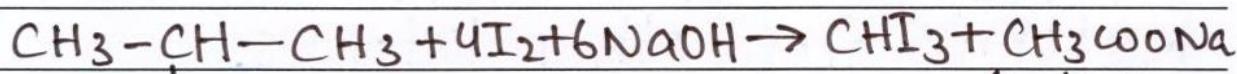

$\text{RCOONa} + \text{NaI} + \text{H}_2\text{O}$   
(sodium salt of carboxylic acid).

### ALCOHOLS:-

In case of primary alcohols, only ethanol will give this test positive.

In secondary alcohols, those containing  $\text{CH}_3-\underset{\text{OH}}{\text{CH}}-\text{R}$  group will give this test.

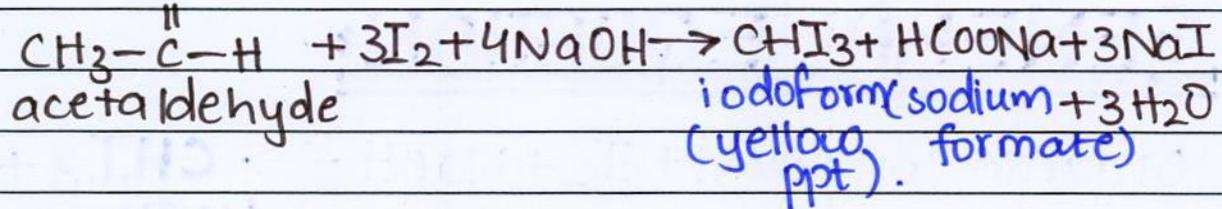

**Q. No. 5 (Page 2/6)**

Q. No. 5 (Page 2/6) \_\_\_\_\_  
while tertiary alcohols will not give this test.

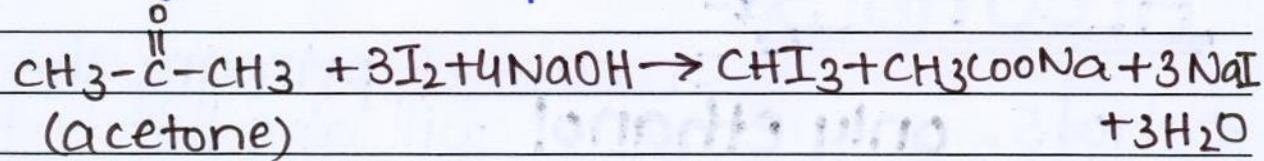

## ALDEHYDES:

Acetone will give iodoform test. Only acetaldehyde

## KETONES:

REVIEWED: only methyl ketones will give this test positive.

## ⇒ APPLICATIONS :-

- It can be used to distinguish ethanol from methanol.
  - It can be used to distinguish acetaldehyde (ethanal) from other aldehydes.
  - It can be used to distinguish methyl ketones from other ketones.

23052831

Q. No. 5 (Page 3/6)

b)

## OZONE HOLE

"Ozone hole is a region of ozone layer in the stratosphere where **ozone concentration has reduced** (ozone depletion)."

Scientists discovered it in the region of **Antarctica**. Due to absence of ozone, **harmful ultraviolet radiations** from the Sun **reach Earth**. The higher concentration of ozone in atmosphere is due to the fact that it is depleting in stratosphere.

## FORMATION OF OZONE HOLE

Ozone depletion is caused by following three dominant factors:-

### a) OXIDES OF NITROGEN:

Oxides of nitrogen destroy ozone to regenerate themselves. They cause **70% of ozone depletion**. Greater the concentration of oxides of nitrogen, greater will be ozone depletion.

The relevant question should be answered only in the allotted space and inside the outer mark

Q. No. 5 (Page 4/6)

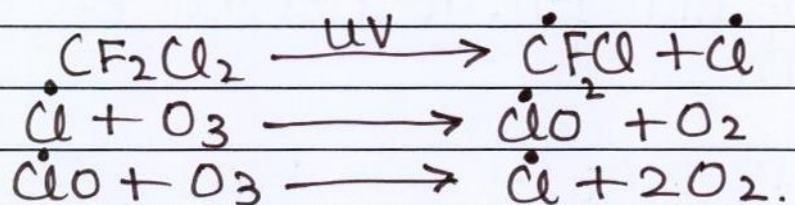

### b) NUCLEAR TESTS:

Nuclear tests being conducted throughout the world generate high temperature. At this high temperature,  $N_2$  and  $O_2$  in the atmosphere combine to produce oxides of nitrogen which destroys ozone layer in the following way:-

### c) CHLOROFLOROCARBONS:

The major source of ozone depletion are chlorofluorocarbons (CFCs) like Freon-1 ( $CFC_3$ ) and Freon-2 ( $CF_2Cl_2$ ). They are chemically inert and are used as aerosols, refrigerants, in fire extinguishers and for cleaning electronic components. They diffuse into stratosphere where by the action of UV light breakdown into **chlorine free radicals** which destroys ozone layer:

ستھان سوال کا جواب صرف مختصر کردہ جگہ پر اور یہ روپی نشان کے اندر دیا جائے۔

23052831

Q. No. 5 (Page 5/6)

## PROTECTION OF OZONE LAYER

### [USE OF HYDROFLUOROCARBONS]:-

Scientists are searching an alternative for CFCs and they have started using **HFCs or hydrofluoroalkanes**. These molecules **donot contain Cl-atom** which can form chlorine free radical. Also **C-H bonds are reactive** and degenerate before reaching stratosphere, hence **donot harm ozone layer.**
